System: Fixed-Node DMC for 1D Harmonic Oscillator (Odd Parity)

Potential

$$V(x) = \frac{1}{2}\omega^2 x^2$$

Trial wavefunction (odd parity)

$$\psi_T(x) = x e^{-\alpha x^2/2}$$

The fixed node at $x = 0$ enforces odd parity. This cell defines the Hamiltonian and trial wavefunction, initializes walkers, and runs fixed-node DMC.

Results

Exact odd-parity (first excited) energy

$$E_1 = \frac{3}{2}\omega$$

This cell reports the post-equilibration energy and plots the reference energy, population, mean local energy, and local-energy variance over time, plus the final walker density.
