## System: 1D Harmonic Oscillator (No Importance Sampling)

### Potential

$$V(x) = \frac{1}{2}x^2$$

**Trial wavefunction** No importance sampling is used in this notebook (effectively  $\psi_T(x) = 1$ ).

This cell defines the Hamiltonian, initializes walkers, and runs the simulation.

```
In [8]: # System: 1D harmonic oscillator
V(R) = 0.5 * R[1]^2
H = Hamiltonian(1, 0.5, V)

# Walkers and params
targetN = 5000
walkers = [Walker([2 * rand() - 1]) for _ in 1:targetN]

params = DMCPParams(0.005, 400, 50, targetN, 0.5, 0.1, 10, 50)

# Run
rng_sim = MersenneTwister(42)
sim = DMCSim(H, params, walkers, rng_sim)
run_simulation!(sim; snapshot_steps=[params.nsteps])

ET_history = sim.ET_history
population_history = sim.population_history
energy_mean_history = sim.energy_mean_history
energy_variance_history = sim.energy_variance_history

nothing
```

## Results

## Exact ground-state energy

$$E_0 = \frac{1}{2} \text{ (a.u.)}$$

This cell reports the post-equilibration energy and plots the reference energy, population, mean local energy, and local-energy variance over time, plus the final walker density.

```
In [9]: # Results and plots
t = (0:params.nsteps) .* params.dt
E_ref = 0.5

nequil = params.nequil
start_idx = min(nequil + 1, length(energy_mean_history))
postE = energy_mean_history[start_idx:end]

Ebar = mean(postE)
SEM = (length(postE) > 1) ? std(postE) / sqrt(length(postE)) : NaN

Ebar_str, SEM_str = format_with_uncertainty(Ebar, SEM)
println("H0 DMC energy (post-eq, nequil=$(nequil)): E = $(Ebar_str) +/- $(SEM_str) eV")
E_final_str, var_str = format_pair_sigfig(energy_mean_history[end], energy_variance_history[end])
println("Final step: E = $(E_final_str), Var(E_L) = $(var_str) eV")
println("Reference energy: $(format_sigfig(E_ref; sigfigs=2))")
```
